

Project 1: CrayolaDraw

using a list of crayola standard colors
to make an interactive drawing website

<https://renaidn.github.io/CrayolaDraw/>

Functions

- Drawing on canvas
- Changing canvas orientation
- Changing canvas size
- Saving canvas as jpg
- Clearing canvas
- Copying hex of the current color
- Choosing brush
- Choosing brush size
- Choosing color from the palette given (eyedropper tool imitation)

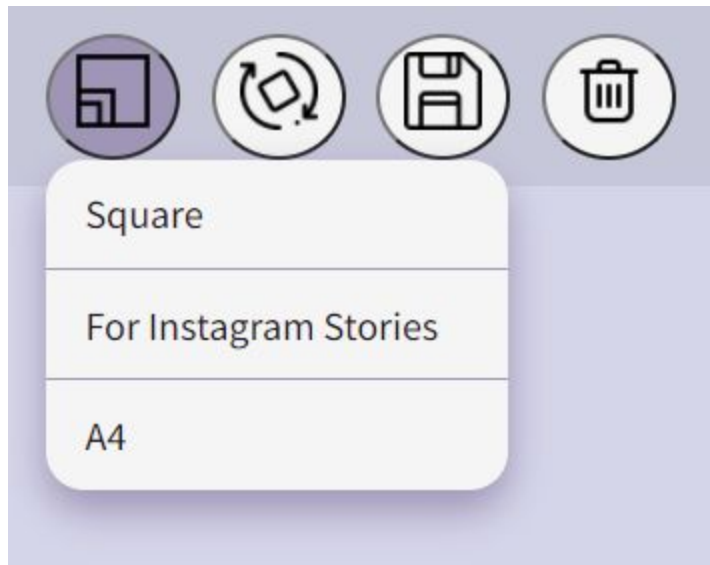

CrayolaDraw

color: Outer Space
hex: #414A4C

5

dropdown menu showing when user hovers over button (either artboard resize or artboard orientation adjust)

127.0.0.1:5500 says

Copied color hex: #414A4C

OK

Alert Window pops up when color hex is copied

List of little things I found enjoyable about this project

- making colors into variables declared in “:root” selector of CSS (makes me feel smart and is generally useful)
- interactivity level of the website (though there are some things to add, it doesn't feel like an incomplete piece to me)
- overall aesthetic of the website (prettiest thing I have made so far)
- brush textures
- lack of text on page

```
1  /* CUSTOM COLORS */  
2  :root {  
3      --white-shade:  whitesmoke;  
4      --darkest-purple:  rgb(99, 99, 141);  
5      --lightest-purple:  rgb(213, 213, 233);  
6      --light-transitional-purple:  rgb(199, 199, 218);  
7      --dark-transitional-purple:  rgb(159, 149, 182);  
8      --black-shade:  rgb(28, 20, 36);  
9  }
```

Things to work on / add

- Naming things properly from the start (cleaning the code was a painful process)
- More functionality / more options / more of everything
- Perhaps a guessing game with the colors? (crayola color shade names are fun but I have discovered it quite late into the process)
- Responsiveness (it's not. at all.)
- Zooming in / out of canvas
- Active brush visual cue
- Maybe some other type of visualization for successful color code copy (alert windows are somewhat not aesthetically pleasing)
